

Ouroboros V0.2 \Rightarrow V1.0 plans

* The insulated (w/epoxy) \Rightarrow core seems to have a stronger magnetic flux field.
 \rightarrow Frequency sweeps were captured at different dipole positions to determine harmonic resonance. The MEG seems to have higher gain on the output w/ higher frequency! This might give us the Over Unity Effect Lt. Bearden's model achieved. Though any nettable effect (+100%) was outside of our equipments current capabilities.

So, in order to maintain cost effectiveness & ease of re-production we will begin development of V1.0 (self sustaining switching) starting next week.

The dev stream E073 includes a short brief of V1.0's plan & circuit which will subsequently be added to this dev journal!
