

Ouroboros V0.1 Testing

⇒ Frequency Sweeps were performed with varying different kinds of waves. The "E field transformer" is acting as a traditional Inductor as of this stage in development.
No over unity effect witnessed.

* We did however clean up our testing apparatus while also designing a custom waveform that results in a "standing wave" Energetic effect; which will be useful at later stages of development when we move away from a "test bench" setup & move back to designing for "everyday" "leighmans" use.

NEXT: we will begin investigating different transformer core orientations as well as isolating all airgaps that we can with different epoxy resin insulation castings; in order to isolate the B fields & "swirling".

→ As recommended by Leo Carden (deceased)

⇒ IF these results are still negligible we will then begin investigating different material properties & carrier wave E magnitudes
