

Ouroboros V2.s Testing

* After re-analysis of our test setup & the general "Occult physics" nature of SEALAR electromagnetics (check Ouroboros Dev Stream {0103} for more info); I've concluded & hypothesized that ~~both~~ (all) \vec{A} & $\vec{\Phi}$ Magnetic or Electric (any) quantum field or potential is most likely a SCALAR form of Energy outside the traditional 4D energies we observe w/ transverse or longitudinal waves. Therefore; Bearden's MEG & \Rightarrow our Ouroboros need to create a \vec{B} field wave collision to achieve a SCALAR energy perturbation that will satisfy $\frac{dA}{dt} = -E$.

* I also hypothesize that our most damped frequency when running our network analysis of V2 (60.5/KHz) would then result in the greatest amount of magnetic curl coming from the coils. We could test this w/ magnetic
